MILITARY USE OF THE SOVIET ATOMIC EVENCY

. Introduction

Since the Soviet Union has reached the threshold of an atomic era, it has consistently advocated the prohibition of stonic and hydrogen weapons and has been acting as if this was the prerequisite for the peaceful use of atomic energy. But the Seviet Union is devoting its entire national energy in preparing for an atomic war, unmindful of its contradiction with what it has been advocating.

It is a plain fact that the USGR is actually conducting research on, manufacturing of, experimenting with, and the stockpiling of, the atomic weapons and hydrogen bombs and guided missiles and trajectory weapons. This is regarded as necessary because "at present there is no definite guarantee of permanent peace because the agreement concerning the prohibition of atomic weapons and the reduction of armed strength has not yet been reached and because the security of Europe has not yet been achieved." (Zhudenev) Even more plainly, it is said that the USSR has no choice but to work on such weapons "so long america opposes the prohibition of atomic and hydrogen weapons and so long as disarmament is not carried out." (Mikoyan) Moreover, the USGR has been saying repeatedly, and it still does, that it will fight for "disarmament, prohibition of atomic and hydrogen bombe, and peaceful coexistence" because these are the decisive means to guarantee permanent peace. But such an argument could be made equally by the US.

We, therefore, want to ask the following question: What does the Soviet Union think about the atomic war? How is the preparation for

✓ SECRET

atomic war, including experiments on atomic and hydrogen weapons, being carried out?

To answer these greations, we will not depend on estimates and data published in Western Muses but will mainly analyze data published in the USSR and add some of our own comments on them. We will only data concerning such items as the assume of attacks and hydrogen bunks stock-piled by the Seviet Wallin or on data on guided affective and adversary.

B. Soviet Vision's Vision on Atomia Nor

To judge how the Soulet Union views the atomic war, it is first necessary to clarify the efficial interpretation of the Soviet authorities concerning the power of atomic measure.

As an official interpretation of the Seviet authorities we atomic weapons, the reply unds by Stalin to the surrespondent of the Sunday Times on 17 September 1946 by office worked in photony years.

Stalin's statement while "The ationic bond for a threat to those with delicate nerves; it does not determine the old of the may!".

Although 14 35 got known whether Stalin une thinking cortonally, he has evaluated the stands guarant as a means of psychological verfare.

And, along with this there on the pours of the stante weapons, there is the following "specialists", thick was been fine the evaluation of experiences of the film of the Smat Patherback, "on the possibility of a third world wart.

SECRET

WHALLOW A

room for doubt that such a war will be the grant not only for the entire world. "

(Malenkov, 6 November 1949)

**Inco-the Soviet-Union had already passessed atomic weepons in 1900.

Since the Soviet Union had already possessed atomic weapons in 1949, it is believed that Malenkov must have considered that next war will an atomic war. One gets an impression from Malenkov's statement that next war, even with the appearance of atomic weapons, will not differ much from the last war, and this impression probably comes from the fact that the development of Soviet atomic weapons undoubtedly was not so advanced at the time Malenkov made his statement.

Nevertheless, this statement by Malenkov and Stalin's interpretation have been quoted in earnest by the Soviet Union and Communists throughout the world for a long time.

Then on 12 March 1954, one year after Malenkov had taken over the Premiership after the death of Stalin, the same Malenkov gave a different interpretation in his election speech before the Supreme Soviet.

In that speech, Malenkov declared that a new war waged with the most modern weapons will mean the destruction of the world civilisation. Since the USSR already had been in possession of the hydrogen bomb since August 1953, "the modern weapons" was in reference to the hydrogen

SECRET

bomb -- in other words, it indicated a thermonuclear weapon and these words negated the efficial Soviet views on atomic weapons existing up to that time and clarified that the Soviet Union was giving a second look at the power of the hydrogen bomb as a weapon of mass-killing and destruction.

Malenkov's view was also indicated in the Soviet government's note to the US, Great Britain, and France on 31 March 1954. This note, which requested that the Soviet Union be admitted as a member of the NATO, contained the following passage:

"The destructive force of atomic weapons is becoming more and more powerful and, in addition, hydrogen weapons, the power of which is far greater than the power of atomic weapons, have made their appearance. If the atomic and hydrogen weapons are used in the war, they would bring-incalculable unahppiness to the peoples, would bring the mass killing of the peaceful population, and would result in the destruction of not only the capitals of the world which are the centers of the old civilization but also of modern industrial cities and centers of culture and science. There will be no doubt about such a destruction."

On the basis of this passage alone, it seems that the Soviet Union was thinking very seriously of the tragis character of the hydrogen bomb and that it was trying to prevent such a war for the sake of humanity. But this attitude changed on 26 April 195k when Premier Malenkov, in his report to the Supreme Soviet, declared that if the agressors, relying on atomic weapons, decided to test Soviet strength and capability, the

SECRET

Approved For Release 2008/01/18: CIA-RDP83-00418R006900750001-2

SECRET

aggressors probably will be destroyed by the same weapons. And there was no doubt, Malenkov added, that such an adventure will inevitably result in the destruction of the capitalistic social system.

It can be stated, therefore, that Malankov's statement was either an effort to correct his election speech of 12 March or to amounce that the Soviet Union having gained confidence in the hydrogen weapons, had decided to use such weapons for retaliation.

To assure the "destruction" of the "popitalistic social system" and the survival of the Seviet Union in a hydrogen-bonb war, the Soviet Union must have an effective defense against atomic and hydrogen weapons. Concerning this problem, <u>Pravda</u>, on 17 September 1954, quoting from TASS, reported that "as a result of an experiment on a certain type of atomic weapons, an important result, which will lead to the solution of the problems conserming the defense against an atomic attack, has been achieved."

Does this mean that the Seviet Union has gained confidence in the manufacture of hydrogen weapons and in the defence against such weapons?

In a speech before the Sepreme Seviet on 8 February 1955, Foreign Minister Melotov beldly declared; "In the production of hydrogen weapons, the Seviet people have succeeded to the extent that it is the US, not the Seviet Union, which is behind." He asserted further, "All risks which accompany in igniting a new world war will inevitably bring about an evil result to the aggregor."

In that case special, Melecial emphasized. We notice home are attacked in a new expression, it will not be the downfall of the 'world culture" but of the modal quotes which is already decayed to the core and which is standing as the Meed-emphasized foundation of Importalism."

It some that Panish Minister Malety of Spatished contained a political gesture discussed at describe and Service and and, but the Minister of Defense Minister a Malety's Material, make on 7 February 1955 in his 'interview with Starge and Shapebory-Saith, was now realistic and had good pures.

In death, the first water the first that there are an extreme damped at the first that there are an

a war would not lead to the destruction of "the world civilisation" and that even in such a war the Seviet Union would survive.

There was further clarification one year later of the Soviet views when First Deputy Fremier Mikeyan spoke at the 20th Congress of the Communist Party of the USSR on February 1956. Mikeyan stated: "An atomic-hydrogen war will result in a great destruction but it cannot result in the extermination of mankind or its civilization. It will exterminate the obsolete and harmful system -- imperialism."

that the hydrogen war will result in a "war of mutual destruction" and that it will result in Communion playing the role of the phoemix or, that, at worse, it will result in the collapse of the markind and its civilization." Hikoy an's expression seems to contain two thoughts.

One is that the progressive pagment of the markind will unite and rise against the class which plots an atomic war and will put on a "straight-jacket" on the aggressers and "put an end to all forms of war and to capitalism." The other is that the hydrogen war, of course, will be unprofitable for the manupaly capital and that such a war will "result in the destruction and external and that such a war will "result in the destruction and external and that such a war will "result in the destruction and external and that such a war will "result in the destruction and external and that such a war will "result in the destruction and external and that such a war will "result in the destruction and external and that such a war will play the role of the "phoemix."

At this point, we would like to ask the Soviet Union, if it truly desires permanent peace, why it cannot state electly that the hydrogen bomb will "destroy markind and its civilisation"? Moreover, why is it

rydrogen bomb, always explain about its "immense destructive power"
at never touch on the "ashes of death"? Our doubts increase in
direct proportion to the intensification of the USSR's so-called "peace"

G. Experiments on Atomic and Hydrogen Meanage

Approximately two years after Moletov, in Movember 1947, amounted that "in the Soviet Union secrety ever atomic bomb does not exist," the first atomic explosion by the Soviet Union was announced in September 1949 by President Truman.

According to the <u>Prevde</u> publication of 25 September, this first experiment was conducted in July 1969.

Two years later, in September 1951, another experiment on atomic bomb was carried out. The amnouncement of this experiment was made by Premier Stalin in his interview with a <u>Pravda</u> reporter, the result of which appeared in that paper on 6 October that same year. Still another atomic explosion was confirmed.

For the next two years, not a single atomic explosion in the Soviet Uniorwas confirmed and no armouncements or statements regarding this was made. Consequently, all kinds of rumors were rampant in the various countries, but finally on 8 August 1953 Malenkov cleared up the mystery-

Premier Malenkov declared: "I believe it is necessary to report to the Supreme Soviet that the United States also is not a monopolist

in the manufacture of the hydrogen bomb. In other words, what Malenkaw said was that the Soviet Union had succeeded in producing the hydrogen bomb during those two years.

Malenkov's statement was soon confirmed as a fact. In the 20 August 1953 issue of Pravda, the following passage under the title of "Report of the Government Concerning the Experiment on the Hydrogen Bomb in the USSE": In the last few days, the Soviet Union has exploded a type of hydrogen bomb for experimental purpose. Since a powerful thermonuclear reaction took place inside the hydrogen bomb, the explosion was powerful. The experiment indicated that the force of the hydrogen bomb was many times greater than that of the atomic bomb."

Analysis of the Soviet hydrogen bomb showed that it was a dry home (kansel basudan) which utilised the nuclear fusion reaction of lithium deuteride and that this bomb was cheaper to produce than the US's wet bomb (shissel bakudan) which primarily utilised tritium. Moreover, since it was surmised that the Soviet bomb was capable of being carried in an aircraft, it was thought that the Soviet Union was in a position superior to that of the US, so far as it concerned thermonuclear weapons.

This superiority of the Seviet Union was wiped out when the US conducted its Bikini test in March 195k, thus putting both countries on the same level in the hydrogen bomb race. In August 195k the Seviet Union again resumed its atomic weapons test, which was amounted in Prayda on 17 September 195k.

At that time, Pravda amounced: "In accordance with the plane for scientific research project, a test on a certain type of atomic weapons was conducted in the Soviet Union during the last few days. The purpose of this test was to learn the effects of the atomic bomb explosion. Purough this test, the scientists and technicians of the Soviet Union have achieved important results which will contribute greatly to the solution of the problems concerning the defense against an atomic attack."

explosions. On the night of 23 November, the US Atomic Energy Commission announced that the Soviet Union had conducted its biggest atomic bomb test up to that time. The explosion had a force of several megatons, it was announced. First Secretary of the Party Khrushhev also confirmed this test while he was traveling in India. Prayda, on 27 November,

"Recently, in accordance with the scientific research and experimental activity plans in the field of atomic energy, experiments on a number of new-type atomic and thermonuclear weapons were conducted in the Soviet Union. The experiments indicated new, important achievements of the Soviet scientists and technicians and, at the same time, proved the accuracy of the various scientific and technical balculations. The explosion of the hydrogen bomb at the end was the most powerful all the explosions up to this time. The explosion was made at high altitude in order to prevent radiation effects. Suring this explosion, a broad study was made on the protection of the personnels."

A SCHOOL

From the latter part of March and up to the early part of April in 1956, the Soviet Union conducted a nuclear test. According to the 2 April announcement by the US Atomic Energy Commission, the Soviet Union has exploded 60 atomic and thermonuclear bombs, including the latest one.

It can be said, therefore, that the nuclear bomb test race among the US, the USSR, and Great Britain really has begun in earnest.

D. Preparation for the Atomic War

1. Reorganisation of Military Science and Tactics

During the World War II years, the military science in the beviet Union was invariably referred to as the "Stalin Military Science"; this was regarded as the best in the world and was thought to be the basis of all the problems.

But when the possibility of the use of atomic bomb increased and when it has become necessary today to maintain a large quantity of the most complicated equipments, the military theory of the World War II like that of the "Stalin Military Science" became imadequate to cope with the new situation. Now that the Soviet Union is producing its atomic and hydrogen bombs and knows the power of such bombs through tests, the necessity for reorganising and expanding the "Stalin Military Science" became an urgent exe-

Meanwhile, after the death of Stalin, there was increasing tendency among the military leaders to expound their own theory about the military science and testies.

« SECRET .

25**X**1

25X1

An outstanding manifestation of this tendency was Marshal Motmistrov's thesis entitled "For Constructive Research on the Various Problems of the Soviet Military Science," which was published in Red Flag on 24 March 1955. Another was a collection of theses entitled "Marx-Leninism, Army, and Tactical Theories," which the Ministry of Defense published in March 1955.

In the following, these documents are used as a basis to learn how the Soviet military science and tactics are being reorganized and expanded to cope with a modern war using atomic and hydrogen weapons.

As it is well known, Stalin, in studying the military science, strictly divided into two groups the various factors influencing the progress and the ending of the war. These two groups were the permanent and the temporary or contingent factors. In 1962 Stalin stated: "The fate of the war is not determined by surprise attacks; it is determined by various factors of a permanent nature, such as the organisational capability of the commanding efficers, equipments of the armed forces, number and quality of the divisions, espeit de corps of the troops, and the stability of the home front." This was the so-called "Stalin's genius concerning the permanent factors determining the fate of war" which thereafter became a principal maxim at the military school.

But is Stalin's theme still accurate in coping with the new conditions of an atomic war, and does his theme still hold water in terms of position, role, and significance?

First of all, what the writers, including Marshal Rotmistrov, point out in agreement is that the significance and the role of the surprise attack have become very important.

Harshal Retnictive states? Today the circumstances in which the hydrogen bunbs are used, a surprise attack in a certain case was become one of the decisive confittees, set only at the outset of the war but also in achieving victories throughout the war.

Golomal A. Pyatkin points out? "Under the circumstances in which powerful atomic weapons are used, a susprise attack, for emaple, has a very great significance and it is one of the decisive conditions in achieving successes not only in battles and strategies but also in the entire war." Golomal Petrov also apologatically says: "The Soviet military acienae, although it recognizes that the progress and characteristic ending of the war are determined by the various permanent factors, has never denied the extreme significance of the factor of the surprise attack." He further adds: "At present, accompanied by the increase in the mobility of the Army and by the use of now and powerful types of weapons, the success of surprise attacks of strategic and tactical nature should be extremely significant and it undoubtedly would greatly influence the result of a battle."

The increase in the significance and the rele of the element of such a surprise attack will demand from the military and the people a greater increase of security consciousness, a permanent war proparation, and the maintenance of a position to cope with any situation. There is no open some

SECRE

other reason that the recognition of these demands of military science that makes the Soviet authorities report in their recent speeches and reports such phrases as the "greater increase of security consciousness" and "constant war preparation."

Hovertheless, as also pointed out by Motmistrov, "the increase in the role of the element of surprise abuse does not diminish at all the role of the various factors which determine the fate of the war and which have permanent effect"; on the contrary, "it increases the role and the similicance of these various factors."

For comple, let-us take up the factor called the stability of the home front. This factor, in the final analysis, has the indivisible relationship with the rule of the people in war, and under the various conditions of a modern war this factor because decisive in the following possible situations:

The first situation, as stated in the thocis of Selenel Petrov, is the fact that the "modern war is a war of large armice." The second situation is that in the event of a war employing mass-killing-and-wounding weapons, the "secrifice and devastation demand by such a war will be very great and they will demand from the peoples greater strain, both and physically, epicitually, and movel endurance for greater than that experienced during World War II. The third elements is the fact that "the sole of the base front in a modern war had greatly increased."

Therefore, one can conclude that in an atenie war "the role of the people will become much greater than in any provious ware." It

C THEE

is clear, as regarded in the Soviet military science, that more than ever the factor of the stability of the home front will have a great significance and a great rele-

It is also regarded in the Seviet military science that the spiritual and political factor as manifested in the "esprit de comps of the troops" will have a strong effect in a possible atomic war. Concerning this factor, Engineer Major General G. Pekrovskiy pointed out the importance of this factor in an atomic war.

that "the primary strength in an armed semilict is men" even in an atomic war, the Soviet military science stresses the theory that "the victory in the final analysis depends on the number and quality of the troops, organizations: stillty of the commanding efficiency and commissional unity of the troops, provided that other conditions (such as the material and technical foundations, strategic resources, and fighting techniques) are equal." (Golomal Sobolev).

On the role of the "space" in a war, "archal Retmistrov hopes that it will be a "superior point" for the Soviet Union in an aboute war.

In view of the formation the direction and the value of the element of the surprise attack, door me may the eignificance and the solo of the various permanent factors and, on the contrary, 14 acknowledges that the various permanent factors would even be expanded.

Next, what are the changes that have been made in military techniques (strategy, operational technique, and tactics), which is one of the branches of military science?

Concerning the role of the atomic and hydrogen weapons in military technique, Engineer Major General Pokrevskiy states as follows:

Based on such a concept, Pokrovskiy anticipates the role and the demands for the various types of weapons and equipments in an atomic war as follows:

A WINE!

These are nainly elaboration of various demands on technique, but Pokrovskiy, as a conclusion, prevides the fellowing policy accessful the research in military science;

"It is important for the military commentators, in giving an ineight into the distant fature, to inflante electly the military entlant in connection with the development of suclear science. They may study very carefully the various fields of science, distinguish those which can play a role in the military, and, with this as the backs, determine how a future war would be different from past wars. In doing this, it is also necessary to distinguish what is most important and backs from enoug the many new factors and, at the same this, to consider unt only the analysis of the problems of etunic weapons but also the fature role of neval technique and simulation, 'particularly the role of atomic

4 SECRET

energy in urmanmed, range aircraft, and the pessibility of the use of atomic power generating stations in maval bases and fortified places."

In summarising the reorganisation of military science and techniques.

Defense Minister Thukov declared at the 20th Party Congress as follows:

"The posture Seviet military science, based on the universalisation of the experiences of the war and the subsequent technical developments, has provided the right direction in the construction and training of our armed strength.

"By considering the greater progress of science and technique and the appearance of new mass-killing methods and weapons, we must further decide on the form and method best suited for an armed struggle, study them very thoroughly, and introduce them to the training of our Army."

Marshal Zhukov then described the role of the weapons including atomic bombs and the status and role of the men in war as follows:

"In our thinking, weepons, themselves, cannot determine the fate of battles or operations, even if they are of maximum effectiveness, and they cannot win. Even in future were the results of an armed conflict are determined by men who are willing to defend the interest of their mation, who have deep confidence in their government, who have conviction in the justaces of the war min, and who make effective use of war material."

2. Strongthoning of the Defence Position

As evident in the foregoing, it is natural that the present Soviet military science is being pushed not only in the military

ecience, is being pushed not ealy in the military preparation for atomic war but also in all economic, political, and sociological fields, as long as the Soviet military ecience is based on the idea that the permanent factors, including the field of atomic and hydrogen bombs, must be superior in position to that of the energies

part in the determination of a 65-percent increase in the rate of the Soviet Union's industrial production for the Sixth Five-Year Plan (1956-60). The breaktorn of this increase gives the increased production rate for producer's goods at approximately 70 percent and the rate for consumer's goods at approximately 60 percent, as usual implementing the industry-first policy, especially heavy industry. Another example is that this Five-Year Plan gives emphasis to the development of natural resources in Eastern Surope and to the stepping up, to a greater degree than those in the Soviet Union as a whole, the tempo of basic construction in Eastern and Mostern Siberia and Easalisten, particularly to the establishment of a metallargical base and the development of power resource in Siberia.

The eastward movement of the Soviet Aminetrial productive power—that he, movement to the actions have the spent in the spentry — and the advance where last past of the business that Middle and Tear Rest and Southeast Asia can be regarded as metastil, from the point of view of defence in a hydrogen-book sea.

Conserving the estimated of Dallace, which was strongenized in 1950, the improvement in the expenientian's articulates has been upod above the last two years and Dallace Majorite Shaher also has implemented than in his report to the 20th Darly Majorite. This denied for improvement is based on

25Y

the necessity to provide military education to young men who will not be entering the Army because of the reduction in the armed strength and on the necessity to plan for the strengthening of the civilian defense. Through various means, every effort is being given to improve civilian eviation sports, especially the technical improvement of gliders and parachuting. Similar effort is being made to discominate scientific and technical knowledge, including the use of atomic energy. The latest trend in emphasizing the spiritual factor in the maticual education cannot be overlooked, either.

As in the above manifestations, the Seviet Union, on the one hand, advocates the lessening of the international tempion expounding the so-called peace policy and advocating the prohibition of atomic and hydrogen reapons and, on the other hand, the Seviet Union plans for the top priority development of heavy industry and cornectly propercy for war.

The Soviet Union represents its war proporation, including [the production of] atomic and hydrogen weapons, as a "defense power" and as a "retaliatory power"; Khruschev also states, "The Soviet Union possibly will not use muclear weapons first." But this position also is the same for Western Europe. Moreover, the Soviet Union stresses that it has responded to the demands for poace by "deeds," not words, in reducing the armed strength by 640,000 and withdrawing from Port Arthur and Porkkala, but these actions have been taken in line with the general trend of war preparation in an atomic- and hydrogen-beat ore and it is unthinkable

The they will influence the power relationship between the US and the Union.

To the Soviet Union, both the consolidation of peace and the preparatop for war are carried out merely "in the interest of the Soviet State."

Therefore, the fact that the Soviet Union is strengthening its war

preparedness while strongly pushing the peace policy is not a contradiction.
